SHORTENED STATUTORY PERIOD OF RESPONSE	MAIL DATE	DELIVERY MODE
3 MONTHS	02/28/2007	PAPER

**Please find below and/or attached an Office communication concerning this application or proceeding.**

If NO period for reply is specified above, the maximum statutory period will apply and will expire 6 MONTHS from the mailing date of this communication.

**Office Action Summary**

Application No.

09/936,286

Applicant(s)

CUNCHON ET AL.

Examiner

Kevin Bates

Art Unit

2155

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
  - If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
  - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 26 January 2007.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 7-12 and 14-16 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 7-12 and 14-16 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
  - ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

***Response to Amendment***

This Office Action is in response to a communication made on January 26, 2007.

Claims 7-12 and 14 have been amended.

Claims 1-6 and 13 have been cancelled.

Claims 7-12 and 14-16 are pending in this application.

***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

**Claims 7 and 10-14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Feigen (5699513) in view of Coile (6473406).**

Regarding claim 7, Feigen teaches a method for allowing a client application to establish, in a client network, a first connection having a first security level with a first port of a server application hosted in a server machine linked to a server network, in order to send messages addressed to the server machine, said messages passing from the client network to the server network through a network layer of a gateway machine (Figure 3, security server is the gateway), the method comprising:

creating a second port in the gateway machine;

rerouting to the second port of the gateway machine, by ordering the network layer of the gateway any message sent and addressed to the first port of the server machine (Column 4, lines 4 – 11);

listening to the second port to detect a request to establish said first connection (Column 4, lines 12 – 19) and;

generating, in the gateway machine, a thread which establishes said first connection (Column 4, lines 22 – 31).

Feigen does not explicitly indicate that any addressed message to the first port is received at the second port, and creating based on the message a connection with the first port of the server application.

Coile teaches a system of providing transparent message security and filtering which includes any addressed message to the first port is received at the second port, and creating based on the message a connection with the first port of the server application (Column 8, lines 49 – 67).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to use Coile's teaching of transparency in Feigen so that the client never has to act according to any packet filtering and separate security issues, and only operate as if using the first server.

**Regarding claims 10 and 11**, Feigen teaches a method according to claims 7 and 8, wherein said creating and rerouting are executed automatically by a first process of the gateway machine and said first process generates a second process that executes said listening and generating (Column 4, lines 12 – 31).

**Regarding claim 14**, Feigen teaches a method for allowing a client application to establish in a client network a first connection having a first security level, directly with a first port of a server application hosted in a server machine linked to a server network, in order to send messages addressed to the server machine, said messages passing from the client network to the server network through a network layer of a gateway machine (Figure 3, security server is the gateway), the method comprising:

generating, in the gateway machine, a thread which establishes said first connection; and

activating, in the gateway machine, a secure application proxy that reroutes the messages from the first connection, in a way that is transparent to the client application (Column 4, lines 4 – 11), so as to establish a second connection having a second security level with the server application, said second connection being unknown to said client application (Column 4, lines 22 – 31),

wherein said generating is performed in response to the detection of the request addressed to the first port of the server application to establish said first connection.

Feigen does not explicitly indicate that any addressed message to the first port is received at the second port, and creating based on the message a connection with the first port of the server application.

Coile teaches a system of providing transparent message security and filtering which includes any addressed message to the first port is received at the second port, and creating based on the message a connection with the first port of the server application (Column 8, lines 49 – 67).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to use Coile's teaching of transparency in Feigen so that the client never has to act according to any packet filtering and separate security issues, and only operate as if using the first server.

**Claims 8-9 and 15-16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Feigen in view of in view of Coile (6473406), and in further view of Winiger (5845068).**

**Regarding claim 8,** Feigen teaches a method according to claim 7.

Feigen does not explicitly indicate defining a third port of the server application for receiving at least one of the messages with a second security level; wherein said thread comprises:

establishes said first connection in a first phase with the first security level in a first interface associated with the second port and with said request;

establishes in a second phase a second connection with the second level of security in a second interface to the third port in the server machine;

writes with the second security level in the second interface any message read in the first interface with the first security level in a third phase, and

writes with the first security level in the first interface any message read in the second interlace with the second security level in a fourth phase.

Winiger teaches a method according to claim 7, further comprising:

defining a third port of the server application for receiving at least one of the messages with a second security level (Column 4, line 67 – Column 5, line 4); and whereas said thread comprises:

establishes said first connection in a first phase with a first security level in a first interface associated with the second port and with said request;

establishes in a second phase a second connection with a second level of security in a second interface to the third port in the server machine (Column 4, line 67 – Column 5, line 6, where the system allows a new connection to open and request a socket of the server application, if the socket is open it allows a new connection to be made at a specified security level, which can be different then a previously opened socket or port which is operating at a completely separate security layer or label);

writes with the second security level in the second interface any message read in the first interface with the first security level in a third phase, and;

writes with the first security level in the first interface any message read in the second interlace with the second security level in a fourth phase (Column 5, lines 10 – 14; Column 4, lines 44 – 51 where when the system opens a socket at a certain security level it responses with the response that contains the identification of the security level in the response header).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to use Winiger's teaching of multiple security classification levels in Feigen's system in order to allow a certain resources to be accessed by only certain clearance levels, which increases security and flexibility.

**Regarding claim 9**, Feigen teaches a method according to claim 8.

Feigen does not explicitly indicate deleting by ordering the network layer of the gateway machine, any message sent to the third port.

Winiger teaches deleting by ordering the network layer of the gateway machine any message sent to the third port (Column 6, lines 6 – 9).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to use Winiger's teaching of multiple security classification levels in Feigen's system in order to allow a certain resources to be accessed by only certain clearance levels, which increases security and blocks invalid attempts at resources which clearance has not been granted.

**Regarding claim 12**, Feigen teaches a method according to claim 9, further comprising automatically executing the steps of creating, rerouting and deleting by a first process of the gateway machine and generating by said first process a second process that executes the steps of listening and generating a thread (Column 4, lines 12 – 31).

**Regarding claim 15**, Feigen teaches a method according to claim 10.

Feigen does not explicitly indicate defining a third port of the server application for receiving at least one of the messages with a second security level deleting by ordering the network layer of the gateway machine, any message sent to the third port.

Winiger teaches defining a third port of the server application for receiving at least one of the messages with a second security level (Column 4, line 67 – Column 5,

line 4) and deleting by ordering the network layer of the gateway machine any message sent to the third port (Column 6, lines 6 – 9).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to use Winiger's teaching of multiple security classification levels in Feigen's system in order to allow a certain resources to be accessed by only certain clearance levels, which increases security and blocks invalid attempts at resources which clearance has not been granted.

**Regarding claim 16**, Feigen teaches a method according to claim 15, further comprising: automatically executing said creating, rerouting, and deleting, by a first process of the gateway machine, and generating, by said first process, a second process that executing said listening and generating (Column 4, lines 12 – 31).

### ***Response to Arguments***

Applicant's arguments filed January 26, 2007 have been fully considered but they are not persuasive.

The applicant argues that the reference, Feigen, does not explicitly indicate generating a thread in response to the detection of the request addressed to the first port of the server application.

The examiner agrees, that the reference, Feigen, teaches the second request in the system being directed to the security host rather than the port on the server application. However, Coile, the reference teaches an improved handler of intercepting server requests that is transparent to the client. This transparency means that the client

will always address the server, while the interceptor and security process checks the requests and forwards valid requests to the server application (Column 8, lines 49 – 67). So as seen the combination of the references teach the claimed limitation.

### ***Conclusion***

**THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Kevin Bates whose telephone number is (571) 272-3980. The examiner can normally be reached on 9 am - 5 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Saleh Najjar can be reached on (571) 272-4006. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Art Unit: 2155

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
